Division of Experimental Animal Research in Riken contributed to prepare mouse tissues. First strand CDNA was primed with a primer [5] GAGAGAGAGAGACATCTTTTTTTTTTTTTTV 3], CDNA was an expected by using trehalose thermo-activated reverse transcriptise and subsequently enriched for full-length by cap-trapper. Second
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The FANTOM Consortium and the RIKEN Genome Exploration Research Group Phase I & II Team.

Analysis of the mouse transcriptome based on functional annotation of 60,777 full-length cDNAs

//cone_adptor; Site_2: Xhoi (3, linker primer); The mixed organ cDA library was generated using the ZAP-CDNA method organ cDA library was generated using the ZAP-CDNA method organ cDA library primer containing an oligo dT sequence preceded by a synthetic Xhoi site. 5 prime adaptors were used containing an ECORI cohesive end. The finished cDNAs were inserted in to the ZAP express vector with respect to the lacZ promoter of pBK-CNV. An amplified library was prepared from approximately allilion primary closes in the lambda ZAP Express vector. In vivo excision was then used to generate individual pBK-CNV phagemid clones for

                                                                                                                                                                                                                                                                                                                                                 60
                                                                                      The present sequence represents a murine parkin2 polypeptide. Mutations or deletions in the parkin2 gene cause Parkinson's disease in humans. The human parkin2 gene is located in gene region 6q25.27. Parkin2 polypeptides and polynucleotides are useful for analysing neurodegenerative diseases. They are also useful for testing the efficacy of the treatment of a neurodegenerative disease such as Parkinson's disease, Hutington's disease, amyotrophic lateral sclerosis, Multi-system arrophy, Milson's disease, Prion disease, and secondary causes inducing Pick's disease. Frion disease, and secondary causes inducing Parkinson's syndromes like toxins, draugs, brain tumours, head trauma, stroke, vascular irregularities or metabolic irregularities, associated with a less active or non-active parkin protein.
                                                                                                                                                                                                                                                                                                                                                                    I MIVEVRENSSYGEPVEVDSDISILOLKEVVAKROGVPADOLRVIFAGKELPNHITVONCD

```

```
The present sequence represents a murine parking polypeptide. The sequence contains the mutation lysiblash. Mutations or delections in the parking dene cause Parkinson's disease in humans. The human parking gene is located in gene region 6025.2-27. Parking polypeptides and polymicleotides are useful for analysing neurodegenerative diseases. They are also useful for testing the efficacy of the treatment of a neurodegenerative disease such as Parkingon's disease, Allaheimer's disease, Huntington's disease, amyotrophic lateral solerosis. Multi-system arrophy, Wison's disease, Prox disease, Prion disease, and secondary causes inducing Parkinson's syndromes like toxins, drugs, brain tumours, head trauma travely, associated with a less active or non-active parkin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          361 FVFCRDCKBAYHBGDCDSLJEPSGATSQATKVDKRAABQARWEBASKETIKKTTKPCPRC

The sequence contains the mutation Try453Stop. Mutations or deletions in the parking gene cause Parkinson's disease in humans. The human parking gene is located in gene region 6625-2-27. Parking polypeptides and polynucleotides are useful for analysing neurodegenerative diseases. They are also useful for testing the efficacy of the truatment of a neurodegenerative disease such as Parkinson's disease. Althoriter's disease. Huntington's disease, any outpull clateral sciences, and secondary causes inducing Parkinson's syndromes like toxins, drugs, and secondary causes inducing Parkinson's syndromes like toxins, drugs,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents a murine parkin2 polypeptide. The sequence contains the mutation Thr415Aen. Mitations or delections in the parkin2 gene cause Parkinson's disease in humans. The human parkin2 gene is located in gene region 6q25.2-27. Parkin2 polypeptides and polymucleotides are useful for analysing neurodegenerative diseases. They are also useful for testing the efficacy of the treatment of a neurodegenerative disease such as parkinson's disease. Altheimer's disease, Huntington's disease, amyotrophic lateral sclerosis, and secondary causes inducing fastinson's system attophy, Milson's disease, Pick's disease, Prion disease, and secondary causes inducing Parkinson's syndromes like toxins, drugs, brain tumours, head trauma, stroke, vascular irregularities or metabolic irregularities, associated with a less active or non-active parkin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      121 VILDTDSKRDSEAARGPVKPTYNSFFIYCKGPCHKVQPGKLRVQCGTCKQATLTLAQGPS 180

The invention relates to Farkin protein and its corresponding nucleic acid sequence. The mucleic acid sequence is useful for altering the proteocytic processing of Parkin at the pretential cleavage site at Asp. 126. The invention is used in manufacturing or testing a plantaceutical composition for treating and/or preventing a neurological discrete, e.g. Althermet's disease or isohaemic stroke. It also used for detecting the cocurrence of proteolytic processing of Parkin at Asp. 126 in a sample, in monitoring a pocential disposition for a neurodegenerative disease, and for treating, preventing and/or diagnosing Parkinson's disease or other neurodegenerative disorders. The viral vector is used for transforming neuronal cells in vivo or ex vivo. The invention is useful for neurotransplantation into the CMS of a mammal it may be used in screening assays to identify compounds that increase or decrease approprise it is also used in gene therapy. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  61 LOQQSIVHIVÇAPWRKGQEXHATGGEDPRNAAGGEREPÇSLTRVDLSSSVLPGDSVGLA 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  human Parkin mutant protein.
```

```
The invention relates to Parkin protein and its corresponding nucleic acid sequence. The nucleic acid sequence is useful for altering the proteolytic processing of sequence is useful for altering the proteolytic processing of manufacturing or testing a pharmaceutical composition for treating and/or preventing a neurological disorder, e.g. Alzheimer's disease or ischaemic stroke. It also used for detecting the occurrence of proteolytic processing of Parkin at Asp 126 in a sample, in monitoring a potential disposition for a neurodegenerative disease, and for treating, preventing and/or disposing Parkinson's disease or other neurodegenerative disorders. The viral vector is used for transforming neuronal cells in vivo or ex vivo. The invention is useful for neurotransplantation into the ONS of a nammal T may be used in screening assays to identify compounds that increase or decrease

This sequence is a variant of the parking gene found in parkinson's disease patients. The sequences may be used for the diagnosis, treatment (including gene therapy) and investigation of Parkinson's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           VILHIDSRKDSPPAGSPAGRSIXNSFYVYCKGPCQRVQPGKLRVQCSTCRQATLTJJGD

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          polynucleotide sequence contains a deletion, leading to a truncated bycotein. Mutations or deletions in the parking gene cause parkinson's disease in humans or human parking gene is located in gene region 6425.2-27. Parkins polypeptides and polynucleotides are useful for analysing neurodegenerative disease. They are also useful for testing the efficacy of the treatment of a neurodegenerative disease such as Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, Multi-system atrophy, Wilson's disease, pick's disease, prion disease, and secondary causes inducing parkinson's syndromes like toxins, drugs, brain tumours, head trauma, stroke, vascular integularities or metabolic irregularities, associated with a less active or non-active parkin protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      61 CWDDVLIPNRMSGECQSPDCPGTRAEFFFKCGAHPTSDKJTSVALNLITSNRRSIPCIAC

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          LEQUOSIVATVORPRERSHETNASGGDERQSTSEGSIWESRSLTRVDLSSHTLPVDSVGLA 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          61 LEQOSIVHIVQRPRRRSHEINASGEDEPQSTSEGSIWESRSLTRVD.SSHILPVDSVGLA 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents a muxine parking polypoptide. The polypholeocide sequence contains a deletion, leading to a truncated discussion. Mutations or deletions in the parking gene cause Parkinson's disease in humans. The human parking gene is located in gene region 6Q5.2-27. Parking polyphoptides and polynocleotides are useful for analysing neurodegenerative diseases. They are also useful for resting the efficacy of the treatment of a neurodegenerative disease such as Parkinson's disease, Alzielment of a neurodegenerative disease such as Parkinson's disease, Anzielment of a neurodegenerative disease, amyotrophic lateral sclerosis, Multi-system atrophy, Mison's disease, Prion disease, and secondary causes inducing Parkinson's syndromes like toxins, drugs, brain function, head trauma, stroke, vascular intregularilies or metabolin irregularilies, associated with a less active or non-active parkin protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                I MIVEVRENSSYGEPVEVDSDISILQLKEVVAKRQGVPADQLRVIFAGKELPNHITVQNCD

Mutations or deletions in the parking gene cause Parkinson's disease in himmans. The human parking gene is located in gene region 6q25.2-27. Parking polypeptides and polymudicolides are useful for analysing nourodegenerative diseases. They are also useful for testing the efficacy of the treatment of a nourodegenerative disease, and secondary disease, Huntington's disease, Parkinson's disease, Huntington's disease, Parkinson's disease, Multi-system atrophy, Mison's disease, Prion disease, and secondary causey inducing Parkinson's syndromes like toxinis, drugs, brain tumours, head trauma, stroke, vascular irregularities or metabolic irregularities, associated with a less active or non-active parkin protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 MIVEVREMSSYGEPVEVDSDISILDIKEVVAKRQGVPADQLRVIFAGKEIPNHLIVQNCD

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents a murine parkin2 polypeptide. Mutations or deletions in the parkin2 gene cause Parkinson's disease in humans. The human parkin2 gene cause Parkinson's disease in humans, polypeptides and polymorleotides are useful for analysing neurodegenerative diseases. They are also useful for testing the efficacy of the treatment of a neurodegenerative disease such as Parkinson's disease, Alzheimer's disease, Huntington's disease, amyotrophic lateral sclerosis, Multi-system arrophy. Wilson's disease, Prior disease, may secondary causes inducing Parkinson's syndromes like toxins, drugs, brain tumours, head traims. Stroke, yascular irregularities or metabolic irregularities, associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                121 VILDTDSKRDSEAARGP-VKPTYNSFFIYCKGPCHKVQPGKLRVQCGTCKQATTTLAOGP

The polypucleotide sequence contains a deletion, leading to a truncated disease. Mutations or deletions in the parking gene cause Parkinson's disease in humans. The human parking gene is located in gene region 6425.2-27. Parking polypeptides and polypucleotides are useful for analysing neutrodegenerative disease. They are also useful for testing the efficiency of the treatment of a neutrodegenerative disease such as Parkinson's disease. Altherment of a neutrodegenerative disease such as advortoble lateral solections. Will: System althophy, Wison's disease, pron disease, and secondary causes indusing parkinson's syndromes like toxins, drugs, brain timours, head trauma, stroke, vascular infigularities or metabolic irregulatities, associated

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signaling and cell-cell interactions in higher enkaryones for the development of insecticides, therapeutics and pharmaceutical drugs. The invention sequences genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    12;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        :13

The polymucleotide sequence contains a frameshift mutation, leading to a truncated protein. Mutations or deletions in the parkin2 gene cause Parkinson's disease in humans. The human parkin2 gene is located in gene region 6q25.2-27. Parkin2 polypeptides and polymucleotides are useful for analysing neurodegenerative diseases. They are also useful for testing the efficacy of the treatment of a neurodegenerative disease such as Parkinson's disease, Alzheimer's disease, Huntington's disease, amyotrophic lateral sclerosis, Multi-system atrophy, Milson's disease, amyotrophic lateral sclerosis, Multi-system atrophy, Milson's disease, Parkinson's disease, and secondary causes inducing Parkinson's such as the toxins, drugs, brain tumours, head trauma, stroke, vascular irregularities or metabolic irregularities, associated with a less active or non-active parkin protein.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Patent No. US20020548763A1
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Pent, Sharron G.
APPLICANT: Hanzel, David K.
APPLICANT: Hanzel, David K.
APPLICANT: Chen, Wensheng
TITLE OF INVENTION: HUMAN GENOME-DEMIVED SINGLE EXON NUCLEIC ACID FROBES USEFUL FOR
                                                                        APPLICANT: HOWER, MARIUS
APPLICANT: HOWER, MARIUS
APPLICANT: LINK, WOLFGRANG
APPLICANT: BAUMEISTER, RALF
TITLE OF INVENTION: NEURODEGERATIVE DISEASES AND
TITLE OF INVENTION: DESCRIPTIVE DISEASES, AND METHODS FOR FINDING SUBSTANCES AND
TITLE OF INVENTION: IDENTIFICATION OF A NEMATODE GENE
TITLE OF INVENTION: IDENTIFICATION OF A NEMATODE GENE
TITLE OF INVENTION: IDENTIFICATION OF A NEMATODE GENE
TITLE OF INVENTION: 10504-00000
